total field magnetic anomalies can be computed for groups of two dimensional bodies of irregular cross section by assuming each body to be either bounded by a bundle of magnetic pole lines or enclosed by a set of planes within which the surface density of magnetic poles is a constant increasing the number of pole lines through use of an interpolator improves the quality of the pole line method and makes it very useful for computing the anticipated magnetic effect from shallow high magnetization bodies whose surfaces are essentially nonplanar this paper describes a computer procedure which uses both the pole line and bounded plane techniques presents the computer program and its development and gives examples of its use the ability of the method to affect two dimensional terrain corrections in lava covered areas is demonstrated by a realistically modeled lava tube whose anomaly could not have been seen reliably if terrain effect had not been removed
