modern mathematics is constructed rigorously through proofs based on truths which are either axioms or previously proven theorems thus it is par excellence a model of rational inquiry links between cognitive psychology and mathematics education have been particularly strong during the last decades indeed the enlightenment view of the rational human mind that reasons makes decisions and solves problems based on logic and probabilities was shaken during the second half of the twentieth century cognitive psychologists discovered that humans thoughts and actions often deviate from rules imposed by strict normative theories of inference yet these deviations should not be called errors as cognitive psychologists have demonstrated these deviations may be either valid heuristics that succeed in the environments in which humans have evolved or biases that are caused by a lack of adaptation to abstract information formats humans as the cognitive psychologist and economist herbert simon claimed do not usually optimize but rather satisfice even when solving problem this research topic aims at demonstrating that these insights have had a decisive impact on mathematics education we want to stress that we are concerned with the view of bounded rationality that is different from the one espoused by the heuristics and biases program in simon's bounded rationality and its direct descendant ecological

mathematics education research as a discipline is situated at the confluence of an array of diffuse seemingly incommensurable and radically divergent discourses research claims that have grown out of mathematics education are wide ranging and antagonistic rather than circumscribed by hidebound disciplinary frames while there has never been a unified totalising discipline of knowledge labelled mathematics education research and while it has always been a contested terrain it is fair to say that the master paradigm out of which this field has been generated has been that of cognitive psychology mainstream mathematics education knowledges refracting the master discourse of psychology whereby cognition serves as the central privileged and defining concept clearly delimits its possibilities for serving as a social tool of democratic transformation the central point of departure of this new collection is that mathematics education research is insufficiently univocal to support the type of uncompromising interpretation that cognitive psychologists would bring to it the hallmark contribution of this pathbreaking volume edited by paola valero and robyn zevenbergen is the paradigmatic shift the authors have effected in the field of mathematics education research taking up a position at the faultline of socio cultural analysis and critical pedagogy
